

The threat of sharps injury remains a distressing reality for perioperative nurses.

The operating theatre is a high risk area for sharps injury due to the handling of large numbers of sharps devices in a confined space and under pressure.

- Perioperative nurses are almost 50% more at risk of sharps injury compared to other health care workers.
- Every sharps injury carries the risk of acquiring a potentially life threatening blood borne disease such as hepatitis B, C or HIV.
- A sharps injury can have significant physical, psychological and financial impacts on those injured and their family.

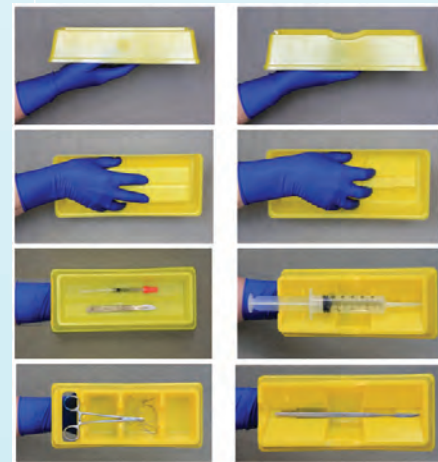

These Sharps Transfer Trays will minimise the risk of sharp injuries in operating theatres.

Available with or without thumb holes

Designed for handling and storage of specific and long sharps instruments throughout the procedure.

A family of trays with a common and intuitive holding form to promote consistent and safe lifting, holding, handling of trays and the safe transfer of sharps.

Comfortable to hold and easy to manoeuvre.
